Braided Heavy Duty Replacement Clutch Line XCH-TY02

This braided clutch line is a replacement line from the master to the slave cylinder on Toyota vehicles utilising the factory dampening valve. The line eliminates the factory dampening valve and hard lines mounted to the firewall which reduces bearing travel and causes a spongy pedal feel. By eliminating this component the friction engagement point will be shorter in the pedal stroke and a more direct pedal feel will be achieved.

The old lines and dampening valve will be completely removed from the firewall and the new braided line will run straight from the master cylinder to the slave cylinder. The braided line can then be neatly tied along the firewall using cable ties or the factory clips.
